1. Read the passage and answer the questions that follow.

Marie Curie was born in 1867 in Warsaw, Poland. At an early age, she displayed a brilliant mind and a cheerful personality. Her great exuberance for learning prompted her to continue with her studies after high school. She became disgruntled, however, when she learnt that the university in Warsaw was closed to women. Determined to receive a higher education, she left Poland in 1891 and went to Sorbonne, a French university, where she earned her master's degree and doctorate in Physics. She was fortunate to have studied at the Sorbonne with some of the greatest scientists of that time

Marie Curie was one of the most accomplished scientists in history. Together with her husband, Pierre Curie, she studied uranium and other radioactive substances. In 1903, the Curies shared the Nobel Prize in Physics with Antoine Henri Becquerel for their joint research on the radiation phenomena. In 1911, she received the Nobel Prize in Chemistry for isolating radium and studying its nature. Till date, she remains the only person to have won Nobel Prizes for two different scientific fields.

Although Marie eventually suffered a fatal illness from her long exposure to radium, she never became disillusioned about her work. Regardless of the consequences, she dedicated herself to solve the mysteries of Physics.
